SUCCESSIVE.

OLIGO-NUCLEOTIDES.

CATALYTIC ACTIVITY: A DINUCLEOTIDE + H(2)0 = 2 MONC SUBUNIT: HOMODIMER, DISULFIDE-LINKED.

SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN.

TISSUE SPECIFICITY: SELECTIVELY EXPRESSED ON THE ST ANTIBODY-SECRETING CELLS.

SIMILARITY: CONTAINS 2 SOMATOMEDIN-B TYPE DOMAINS.

SIMILARITY: CONTAINS 2 SOMATOMEDIN-B TYPE DOMAINS.

"Complete sequence and model for the A2 subunit of the carotenoid pigment complex, crustacyanin.";

Eur. J. Biochem. 197:407-417(1991).

-!- FUNCTION: BINDS THE CAROTENOID ASTAXANTHIN WHICH PROVIDES THE COLORATION TO THE CARAPACE OF THE LOBSTER.

-!- SUBUNIT: OLIGOMER; CAN FORM DIMERS (BETA-CRUSTACYANIN); OR COMPLEXES OF 16 SUBUNITS (ALPHA-CRUSTACYANIN). THERE ARE FIVE TYPES OF SUBUNITS: A1, A2, A3, C1 AND C2.

-!- SUBCELLULAR LOCATION: EXTRACELLULAR, CARAPACE.
                                                                                                             icus (Clostridium thermohydrosulfuricum)
11 lus/Clostridium group;
Thermoanaerobacter.
                                                                                                                                                                                                                                                                                                                                                                                                                      This SWISS-PROT entry is copyright. Gene 120:157-165(1992).

-!- FUNCTION: MAY PROVIDE A DEGREE OF PROTECTION AGAINST MICROBIAL INVASION OF GERMINATED BARLEY GRAIN THROUGH ITS ABILITY TO DEGREE OF PROTECTION AGAINST MICROBIAL FUNGAL CELL WALL POLYSACCHARIDES.

-!- CATALYTIC ACTIVITY: HYDROLYSIS OF 1,3-BETA-D-GLUCOSIDIC LINKAGIN 1,3-BETA-D-GLUCANS.

-!- SUBCELLULAR LOCATION: CYTOPLASMIC (PROBABLE).

-!- SIMILARITY: BELONGS TO FAMILY 17 OF GLYCOSYL HYDROLASES.

```
AAR86559-R86596 represent autotaxin (ATX) and fragments of it. This sequence represents the full length protein sequence of the A2058 melanoma cell line ATX protein. ATX is an autocrine motility stimulating protein which is present in cancer cells. ATX stimulates both random and directed migration of melanoma cells. The tumourous form of ATX is a secreted protein, while the transmembrane bound form is not present in tumour cells. The cDNA encoding this sequence can be used in a vector, to transform cells. The recombinant cells can then be used to produce the peptide sequences. Antibodies specific for these sequences can be produced, and can be used in cancer diagnosis and therapy. Different sites of localisation of the protein are utilised for diagnosis and prognosis of the stages of tumour progression. The sequences can be used in treatment methods to advantageously block the activity of the secreted form of AXT, while having little effect on the membrane form of

Autotaxin is a glycoprotein cytokine which increases insulin signalling in adipose tissue by producing substrate for adenosine receptors, resulting in inhibition of lipolysis, decreased hepatic gluconeogenesis and serum glucose levels, and increased insulin sensitivity. It also inhibits differentiation of adipocytes. Autotaxin has type I phosphodiesterase, adenosine-5'-triphosphatase (ATPase) and ATP pyrophosphatase activities.

Autotaxin and its analogues are used to stimulate glucose uptake by cells, particularly to reduce serum glucose levels for treatment of non-insulin dependent diabetes (NIDDM) in humans, or generally any condition associated with elevated serum levels of glucose, lipid or free fatty acid (e.g. obesity or dyslipidemia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (NIDDM) in humans,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is autotaxin isolated from human teratocarcinoma cells. Autotaxin is a glycoprotein cytokine which increases insulin signalling in adipose tissue by producing substrate for adenosine receptors, resulting in inhibition of lipolysis, decreased hepatic gluconeogenesis and serum glucose levels, and increased insulin sensitivity. It also inhibits differentiation of adipocytes. Autotaxin has type I phosphodiesterase, adenosine-5'-triphosphatase (ATPase) and ATP pyrophosphatase activities.

Autotaxin and its analogues are used to stimulate glucose uptake by cells, particularly to reduce serum glucose levels for treatment of non-insulin dependent diabetes (NIDDM) in humans, or generally any condition associated with elevated serum levels of glucose, lipid or free fatty acid (e.g. obesity or dyslipidemia).

Transgenic animals that overexpress autotaxin are models for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             190
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    186
                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is human autotaxin protein.

Autotaxin is a glycoprotein cytokine which increases
insulin signalling in adipose tissue by producing substrate for
adenosine receptors, resulting in inhibition of lipolysis,
decreased hepatic gluconeogenesis and serum glucose levels, and
increased insulin sensitivity. It also inhibits differentiation
of adipocytes. Autotaxin has type I phosphodiesterase, adenosine-5'-
triphosphatase (ATPase) and ATP pyrophosphatase activities.
Autotaxin and its analogues are used to stimulate glucose uptake
by cells, particularly to reduce serum glucose levels for
treatment of non-insulin dependent diabetes (NIDDM) in humans,
or generally any condition associated with elevated serum levels
of glucose, lipid or free fatty acid (e.g. obesity or dyslipidemia).
Transgenic animals that overexpress autotaxin are models for
human metabolic diseases.

                                                                                                                                                                         The
                                                                                                                         AAR86559-R86596 represent autotaxin (ATX) and fragments of it. ATX is an autocrine motility stimulating protein which is present in cancer cells. ATX stimulates both random and directed migration of melanoma cells. The tumourous form of ATX is a secreted protein, while the transmembrane bound form is not present in tumour cells. The cDNA encoding this sequence can be used in a vector, to transform cells. The recombinant cells can then be used to produce the peptide sequences. Antibodies specific for these sequences can be produced, and can be used in cancer diagnosis and therapy. Different sites of localisation of the protein are utilised for diagnosis and prognosis of the stages of tumour progression. The sequences can be used in treatment methods to advantageously block the activity of the secreted form of AXT, while having little effect on the membrane form of AXT.
                                                                                                                                                                                                             tumour

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         In present sequence is variant (S236T) of rat autotaxin protein. Autotaxin is a glycoprotein cytokine which increases insulin signalling in adipose tissue by producing substrate for adenosine receptors, resulting in inhibition of lipolysis, decreased hepatic gluconeogenesis and serum glucose levels, and increased insulin sensitivity. It also inhibits differentiation of adipocytes. Autotaxin has type I phosphodiesterase, adenosine-5'-triphosphatase (ATPase) and ATP pyrophosphatase activities. Autotaxin and its analogues are used to stimulate glucose uptake by cells, particular to reduce serum glucose levels for treatment of non-insulin deneration diabetes (NIDDM) in humans, or appearance.

The present sequence is variant (S289T) of rat autotaxin protein.

Autotaxin is a glycoprotein cytokine which increases insulin
signalling in adipose tissue by producing substrate for adenosine
receptors, resulting in inhibition of lipolysis, decreased hepatic
gluconeogenesis and serum glucose levels, and increased insulin
sensitivity. It also inhibits differentiation of adipocytes.
Autotaxin has type I phosphodiesterase, adenosine-5'-triphosphatase
(ATPase) and ATP pyrophosphatase activities. Autotaxin and its
analogues are used to stimulate glucose uptake by cells, particularly
to reduce serum glucose levels for treatment of non-insulin dependent
clabetes (NIDDM) in humans, or generally any condition associated
with elevated serum levels of glucose, lipid or free fatty acid
(e.g. obesity or dyslipidemia). Transgenic animals that overexpress
autotaxin are models for human metabolic diseases.
Note: The present sequence is not shown in the specification
but is derived from rat autotaxin protein sequence found in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      and

Autotaxin is a glycoprotein cytokine which increases insulin signalling in adipose tissue by producing substrate for adenosine receptors, resulting in inhibition of lipolysis, decreased hepatic gluconeogenesis and serum glucose levels, and increased insulin sensitivity. It also inhibits differentiation of adipocytes. Autotaxin has type I phosphodiesterase, adenosine-5'-triphosphatase (ATPase) and ATP pyrophosphatase activities. Autotaxin and its analogues are used to stimulate glucose uptake by cells, particularly to reduce serum glucose levels for treatment of non-insulin dependent diabetes (NIDDM) in humans, or generally any condition associated with elevated serum levels of glucose, lipid or free fatty acid (e.g. obesity or dyslipidemia) Transcenticalinia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      or treating diabetes mellitus cells and inhibit lipolysis -

Autotaxin is a glycoprotein cytokine which increases insulin signalling in adipose tissue by producing substrate for adenosine receptors, resulting in inhibition of lipolysis, decreased hepatic gluconeogenesis and serum glucose levels, and increased insulin sensitivity. It also inhibits differentiation of adipocytes.

Autotaxin has type I phosphodiesterase, adenosine-5'-triphosphatase (ATPase) and ATP pyrophosphatase activities. Autotaxin and its analogues are used to stimulate glucose uptake by cells, particularly to reduce serum glucose levels for treatment of non-insulin dependent diabetes (NIDDM) in humans, or generally any condition associated with elevated serum levels of glucose, lipid or free fatty acid (e.g. obesity or dyslipidemia). Transgenic animals that overexpress autotaxin are models for human metabolic diseases.
                                                                                                                                                                            Epitope

                                                                                                                                                                                                           The present sequence is variant (A194V) of rat autotaxin protein.

Autotaxin is a glycoprotein cytokine which increases insulin
signalling in adipose tissue by producing substrate for adenosine
receptors, resulting in inhibition of lipolysis, decreased hepatic
gluconeogenesis and serum glucose levels, and increased insulin
sensitivity. It also inhibits differentiation of adipocytes.
Autotaxin has type I phosphodiesterase, adenosine-5'-triphosphatase
(ATPase) and ATP pyrophosphatase activities. Autotaxin and its
analogues are used to stimulate glucose uptake by cells, particularly
to reduce serum glucose levels for treatment of non-insulin dependent
diabetes (NIDDM) in humans, or generally any condition associated
with elevated serum levels of glucose, lipid or free fatty acid
(e.g. obesity or dyslipidemia). Transgenic animals that overexpress
autotaxin are models for human metabolic diseases.

Note: The present sequence is not shown in the specification
but is derived from rat autotaxin protein sequence found in
                                                                                                                                                                 and

                                                                                                             ð
                                                                                                                                                 ð
                                                                                                     gluconeogenesis and serum glucose levels, and increased insulin sensitivity. It also inhibits differentiation of adipocytes.

C Autotaxin has type I phosphodiesterase, adenosine-5'-triphosphatase (ATPase) and ATP pyrophosphatase activities. Autotaxin and its analogues are used to stimulate glucose uptake by cells, particularly to reduce serum glucose levels for treatment of non-insulin dependent diabetes (NIDDM) in humans, or generally any condition associated with elevated serum levels of glucose, lipid or free fatty acid (e.g. obesity or dyslipidemia). Transgenic animals that overexpress autotaxin are models for human metabolic diseases.

C Note: The present sequence is not shown in the specification but is derived from rat autotaxin protein sequence found in page 101-104 of sequence listing (AAY71986).

AAR86559-R86596 represent autotaxin (ATX) and fragments of it. This sequence represents the full length protein sequence of the teratocarcinoma N-tera 2D1 ATX protein. ATX is an autocrine motility stimulating protein which is present in cancer cells. ATX stimulates both random and directed migration of melanoma cells. The tumourous form of ATX is a secreted protein, while the transmembrane bound form is not present in tumour cells. The cDNA encoding this sequence can be used in a vector, to transform cells. The recombinant cells can then be used to produce the peptide sequences. Antibodies specific for these sequences can be produced, and can be used in cancer diagnosis and therapy. Different sites of localisation of the protein are utilised for diagnosis and prognosis of the stages of tumour progression. The
                                                                   730
                                                                                                                                   790
                                                                                                                                                                                                      50
                                                                                                                                                                                                                                                                        910

The present sequence is autotaxin isolated from rat brain tissue.

This sequence is designated as nucleotide pyrophosphatase

(PD-Ialpha). Autotaxin is a glycoprotein cytokine increases insulin signalling in adipose tissue by producing substrate for adenosine receptors, resulting in inhibition of lipolysis, decreased hepatic gluconeogenesis and serum glucose levels, and increased insulin sensitivity. It also inhibits differentiation of adipocytes.

C Autotaxin has type I phosphodiesterase, adenosine-5'-triphosphatase activities. Autotaxin and its analogues are used to stimulate glucose uptake by cells, particularly c reduce serum glucose levels for treatment of non-insulin dependent c diabetes (NIDDM) in humans, or generally any condition associated with elevated serum levels of glucose, lipid or free fatty acid with elevated serum levels of glucose, lipid or free fatty acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  and

ä AARB6559-R86596 represent autotaxin (ATX) and fragments of it. ATX is an autocrine motility stimulating protein which is present in cancer cells. ATX stimulates both random and directed migration of melanoma cells. The tumourous form of ATX is a secreted protein, while the transmembrane bound form is not present in tumour cells. The croombinant cells can be used in tumour cells. The recombinant cells can then be used to produce the peptide sequences. Antibodies specific for these sequences can be produced, and can be used in cancer diagnosis and therapy. Different sites of localisation of the progression. The sequences can be used in treatment methods to advantageously block the activity of the secreted form of any little effect on the membrane. of the tumour nseq The Gaps 9 70; 979; Length Indels DB 17; 36; Mismatches Score 4279; Pred. ATX an autocrine motility stimulating protein which is present in cancer cells. ATX stimulates both random and directed migration of melanoma cells. The tumourous form of ATX is a secreted protein, while the transmembrane bound form is not present in tumour cells. The cDNA encoding this sequence can be used in a vector, to transform cells. recombinant cells can then be used to produce the peptide sequences. Antibodies specific for these sequences can be produced, and can be in cancer diagnosis and therapy. Different sites of localisation of protein are utilised for diagnosis and prognosis of the stages of tup progression. The sequences can be used in treatment methods to advantageously block the activity of the secreted form of AXT, while having little effect on the membrane form of AXT.
                                                                                                                                                                                                                                                                                                 nseq
